The ligands are useful as analgesics.

encoding acid sensing ion channel subunit ω

ss; sensing ion channel; ASIC3A;

```
CC or their variants having 80% sequence identity, the channel being CC activated by protons, acids, low pH solutions, the nucleic acids CC encoding the subunits, a recombinant bicistronic vector comprising a CC nucleic acid encoding at least two individual subunits or variants of CC ASIC-2S.2, a host cell comprising the vector, an antibody raised against CC one of the subunits or a domain which is capable of disrupting assembly CC and polynucleotides are useful for diagnosing a disease or a crivity of the heteromultimeric channel (e.g. by gene therapy using the vector). Such diseases include chronic pain, neuropathic pain such as CC diabetic-, cancer- and AIDS (acquired immunodeficiency syndrome)-related, neurodegenerative diseases such as Alzheimer's disease, Parkinson's CC disease, Huntington's disease, Creutzfeldt-Jacob disease, and amyotrophic convulsions, epilepsy, stroke, anxiety and depression. They are also cuseful for treating cardiovascular diseases such as angina, congestive heart failure, vasoconstriction, hypertension, atherosclerosis, cc useful in screening for compounds that regulate neurotransmitter release, synaptic efficacy, neuroexcltability or neurotransmitter release, csquence encodes human ASIC3A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neuroprotective; nootropic; antiparkinsonian; anticonvulsant; cerebroprotective; cardiant; antianginal; hypotensive; antiatherosclerotic; vasotropic; tranquiliser; antidepressant; chronic pain; neuropathic pain; diabetes; cancer; AIDS; acquired immunodeficiency syndrome; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; Huntington's disease; Alzheimer's disease; parkinson's disease; Huntington's dementia; convulsion; epilepsy; stroke; anxiety; depression; angina; cardiovascular disease; congestive heart failure; vasoconstriction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diseases associated with expression of the channel e.g. neurodegenerative diseases, comprises two different types sensing ion channel subunits \,

The present sequence encodes a human neuronal acid-sensitive cation channel 3 (ASIC3) protein. The protein is a proton-gated cation channel subunit that has biphasic desensitisation kinetics with both a rapidly inactivating sodium-selective and a sustained component. The channels are sensitive to amiloride. The specification describes ASIC3 proteins, which are expressed in the sensory neurons but not in the brain. The cation transport channel proteins can be used in methods to identify substances capable of modulating the activity of cation transport channels. The human ASIC3 protein is also an acid sensor, and might play an important role in the detection of lasting pH changes in humans.

                                                                                                                                                                                                                                                                                                                            This is the coding region of a polynucleotide encoding a splice variant (see AAW88250) of a new human sodium channel receptor (see AAW88250), termed hSLNAC1. The polynucleotide was obtained from dorsal root ganglia cDNA by PCR amplification using primers (see W842120-21) based on the hSLNAC1 polynucleotide (see AAW84189). hSLNAC1 is a member of a new class of sodium channel proteins that may be responsible for some nervous system transmissions, or may be used as a target to regulate some transmissions linked to various pathologies. The splice variant cDNA has a 79-nucleotide insert in the 3' portion of the coding region. This alters the reading frame. As dorsal root ganglia are involved in pain perception, the splice variant protein is expected to have a function linked to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new sodium channel neuronal degenerate propriet morphine dependence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo

Methods for producing hSLNAC1 polypeptides by recombinant methods are disclosed. Host cells expressing hSLNAC1 can be used to screen for agonists or antagonists of hSLNAC1. Such compounds can be used to treat neurodegeneration, hyperalgesia, Alzheimer's disease, to treat neurodegeneration, hyperalgesia, Alzheimer's disease, cardiac diseases, schizophrenia, depression, nicotine dependence, amyotrophic lateral sclerosis, multiple sclerosis, inflammation, pain, cancer and obesity, to mimic or antagonise the effects of endogenous transmitter peptides, opioids or anti-opioids, to alter gustative perception, to cause analgesia or anaesthesia, or to diagnose or treat any disorder or related to abnormal expression of hSLNAC1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1723

                                                                                                                                                                                                                                                                                                 This cDNA sequence, derived from human cerebellum, shows homology to novel human sodium channel receptor hSLNAC1 polypucleotide (see AAV84189), and hybridises under conditions useable for amplification or for use as a probe or marker. It codes for a 518-amino acid polypeptide (see AAW88251). hSLNAC1 (see also AAW88250) is a member a new class of sodium channel proteins that may be responsible for some nervous system transmissions, or may be used as a target to regulate some transmissions linked to various pathologies.
                                                                                                                                                                                                                                                                                                                                                                                                                A new sodium channel receptor - useful for, neuronal degenerate problems, Alzheimer's, F morphine dependence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDS

This sequence represents the gene encoding a rat neuronal cationic channel that is sensitive to amiloride and activated by protons and is designated Acid Sensing Ionic Channel (ASIC). This sequence represents the rat DRASIC gene. The DRASIC gene is expressed in sensory neuronal cell rather than in the brain as with other members of the ASIC gene family. The protein can be used to screen for modulators of these channels, particularly to identify compounds that modulate perception of acidity, as regards nociception (pain) rather than taste. These compounds are used to treat or prevent pain associated with acidity (e.g. in cases of inflammation, ischaemla or some tumours) and as inhibitors of neurodegeneration caused by overexpression of the channels. The present sequence encodes a rat neuronal acid-sensitive cation channel 3 (ASIC3) protein. The protein is a proton-gated cation channel subunit that has biphasic desensitisation kinetics with both a rapidly inactivating sodium-selective and a sustained component. The channels are sensitive to amiloride. The specification describes ASIC3 proteins, which are expressed in the sensory neurons but not in the brain. The cation transport channel proteins can be used in methods to identify substances capable of modulating the activity of cation transport channels. The human ASIC3 protein is also an acid sensor, and might play an important role in the detection of lasting pH changes in humans.
                                                                                                                                                                                                                                                                                                                                                                                                             Novel
